

In principle, CO₂ can be *captured* from all installations that combust fossil fuels. Capture of CO₂ is already common practice in the chemical and gas industry.

Preferably, CO

2

is captured at large installations like electricity power plants or industrial plants that produce, for example, ammonia, iron and steel, and cement. Capture of CO

2

is common practice in the chemical and gas industry. Large-scale capture at power plants has not yet been demonstrated, although there are several commercial-scale projects worldwide due in the next couple of years (including one in Spain and several in other EU countries).
